

Thanks for all the feedback on the first release of MicroLink. MicroLink version 0.8A is an interim release to cover most of the basic problems found in release 0.80. Included were fixes for an ANSI display problem, UAE scroll problem, Modem connection problems, Pulse tone support, Invalid phone number problems, color problems, high speed refresh problems, and various other minor problems. Included with this package is a sheet discussing the use of the directory services. We are in the midst of rewriting the directory interface and it will be made available in the next release. (0.9). The next release will also have support for ZMODEM, Enhanced display options, better help and documentation, and various other items. This should be available in the next 2-3 months. In about 5-6 months we will be releasing a limited script function, CIS-B and/or Kermit support, and various other minor enhancements. Beyond this we will provide even more terminal emulators, and protocol engines. Please continue to send your ideas, criticisms, and problems. Thanks.
