

RFD Mail List of Known Bugs

The following is a list of known bugs as of version 1.11 of *RFD Mail*:

- When program is shut down while maximized, the next time it is run the windows are not drawn properly. To work around this, manually resize the main window to be the full size of the screen rather than using the maximize button.
- The main window scroll bars are incorrectly redrawn in certain cases when the main window is resized. To correct the window, minimize then restore the main window to force it to be redrawn.
- F1 help key does not work in modal dialogs. To work around this, use the Help button.
- Letter-to-folder and Mail-Fetch dialogs don't have working Help buttons
- Very large letters (>32K) may cause RFD Mail to beep twice when placing them into the Out Box. In addition, word-wrapping on those letters may not work properly.
- When addressing letters to UUNET addresses on a UNIX host, you need to "escape" the "!" characters in your address. So for the address "host1!host2!user", you need to specify "host1\!host2\!user".
