FontLister is a SHAREWARE utility for graphic designers that shows different typeface characteristics as they relate to design. It provides an efficient medium for evaluating typefaces/styles.

The application presents the user with a "font swatch" for a particular face that can be printed or viewed on screen. It can also generate a list of all fonts installed on the system in their own typeface (this can be slow! - if you have a zillion fonts).

The software is used for choosing fonts and generating swatches. To install just place in /LocalApps or your Apps/ directory.

FontLister was developed on a NeXTStation runing 2.1. Future versions will also provide some font metric information, and different font swatches.

Enjoy!
