Object of the Game

The object of *MVP Word Search for Windows* is to find all the words in the word list in the diagram of letters in the shortest time possible. The words can be found in any of the eight directions (right, left, up, down, or the four diagonals). The game supports both lists of words, and lists of numbers. There is a timer in the last pane of the status bar (on the bottom of the screen).

Choosing a Word List to Play

To start playing a game, you must first choose a word list to create the puzzle from. From the **Word List** menu, choose **Select**. From the list box, either double click on the word list you would like to play, or select the word list and click on the OK button. Another way to select a puzzle is to choose one directly from the **Word List** menu. Choose the puzzle you want. See the section [Word List Menu](#) to find out how to choose which puzzles appear in the menu.

Playing the Game

Once you have selected a word list, and a puzzle is generated, you are ready to play. You must find all the words in the word list in the puzzle. To circle one of the words in the puzzle, click the left mouse button on the first letter, and drag without releasing to the last letter. The word is circled as you drag. Once the word you have found is circled, release the mouse button. If the word is one from the list, it is circled in the puzzle and grayed out from the list. Continue to do this until all the words in the list are circled. Once the puzzle is solved, you can choose another one from the **Word List** menu.

Printing Puzzles and Solutions

If you have a default printer set up for Windows, you can print out a puzzle to play later, or give to others. From the **Word List** menu, choose the puzzle you want to print. The puzzle should appear on the screen when you do this. Now choose **Print** from the **Puzzle** menu and the puzzle will be printed. You can also print out the puzzle anytime you are playing. Even if you have already circled some words, they will not be circled on the printed copy.

To print out the solution to a puzzle, choose a puzzle as described in the above paragraph. Then choose **Print Solution** from the **Puzzle** menu. The solution will be printed out.

Word List Editor

You can create your own word lists with *MVP Word Search for Windows*. To do this, select **Editor** from the **Word List** menu. This will bring up the editor, from which you can add a new word list, or edit or delete an existing word list.

To add a new word list, click on the **Add** button. This will bring up the word list editor with no words in it. Click on the title entry field, and enter a title for the word list. The title can be up to 30 characters long, including spaces. This name is only used for referencing the word list, and to display above the puzzle during play. It will not appear in the puzzle itself. To add words to the list, click on the entry field near the center of the window, and type a word. The word must be between three and fourteen characters, including spaces. The spaces will not appear in the puzzle, only in the word list for readability. The word must be composed of characters (A-Z) and spaces, or digits (0-9) and spaces. All words in the list must either be words or numbers. You can not mix them in the same list. Therefore, to create a list of numbers, all you need to do is make the first one a number, and then all the remaining ones will need to be numbers. Another limitation is that substrings are not allowed. For example, if the word PLANET is in the word list, you cannot add the word INTERPLANETARY. When the user saw PLANET in INTERPLANETARY, they would try to circle it, and get angry when it was not considered a word. Once you have a word typed, either press the ENTER key on the keyboard, or click on the **Add** button. Continue to do this until you have added all the words you want in the list. The maximum number of words allowed in a list is 36. If you make a mistake, or decide you want to remove a word, highlight that word in the list by clicking on it with the left mouse button. Then click on the **Delete** button, and the word will be removed from the list. When you are finished with the word list, click on the **OK** button. Clicking on **Cancel** will discard any changes you made.

To edit an existing word list, click the mouse on the word list to edit, and click on the **Edit** button. You can also double click on the word list you want to edit. Follow the same steps in the previous paragraph to add or delete words. You can also modify the title by clicking the mouse in the title entry field, and editing the value.

To delete a word list, click on the word list, and then click on the **Delete** button. You will be prompted if you really want to delete the list. Click on **Yes**, and the word list will be deleted, and removed from the menu (if it was installed in the menu).

Exchanging Puzzles with Others

If you have some word lists that you would like to give to a friend, you can transfer them as a .TWL file that they can load into their copy of *MVP Word Search for Windows*. To do this, choose **Transfer Out** from the **Word List** menu. A file dialog will appear. Type the name of the file you wish to save them as. If you don't type an extension, .TWL will automatically be added. If the file does not exist, it is created. If it already exists, you will be adding to the existing contents. After you have selected a filename, a dialog will appear with a list box containing all your current word lists, along with a list box of all the word lists in the file you specified. To add word lists to the .TWL file, choose one or more word lists in the "Current Word Lists" by clicking on them. Next click on the right arrow button, and the word lists will be placed in the file. Once you have added all the word lists to the file that you want, click on the **OK** button, and the file will be saved.

To load word lists from a .TWL file into your game, choose **Transfer In** from the **Word List** menu. A file dialog will appear. Type the name of the file containing the word lists. If you do not specify an extension, .TWL will automatically be added. After choosing the filename, a dialog box will appear with a list box containing your existing word lists, along with another dialog box containing the word lists in the file. Choose one or more word lists from the "Word Lists in File" list box, and click on the left arrow button. The words lists will be added to your existing lists.

Difficulty Levels

MVP Word Search for Windows provides three difficulty levels. EASY does not place words diagonally. MEDIUM (which is the default) places words in all eight directions (including diagonals). The HARD level is for those that may not feel challenged by the MEDIUM level. Don't get too confident if you think you found a word, because on the HARD level, words that look a lot like the word you are looking for may appear in the puzzle.

To set the difficulty level, choose **Difficulty** from the **Options** menu. Click on the difficulty level you want, and click on the **OK** button. You must select a new puzzle for the change to become effective.

The difficulty level for the current puzzle is always displayed in the second pane of the status bar at the bottom of the screen.

Display of Word Lists

For those who would like a greater challenge, *MVP Word Search for Windows* allows you to scramble or hide the word list.

Scrambling the word list means that the words in the list will be scrambled, but the words in the puzzle are the same as the original word. You can either try to unscramble the word, and look for it in the puzzle, or look through the puzzle for words that look like they belong to the current title (for example, if the title is US Presidents, look for the name of a president in the puzzle, and circle it).

Hiding a word list will only display the title above the puzzle, but you will not be told what any of the words in the list are. You will have to search through the puzzle for words that you think belong to the title. If you circle a correct word, it will be circled, and displayed in your word list.

To choose the display type, choose either **Scrambled**, **Hidden**, or **Normal** from the **Word List Display** submenu in the **Options** menu. This will instantly change the way the word list is displayed. A check is displayed next to the menu item that is currently selected.

SCRAM is displayed in the third pane of the status bar at the bottom of the screen when scrambling is turned on. HIDDEN is displayed in the pane if the word list is hidden, and NORMAL is displayed in the pane if the word list is displayed normally..

Word List Menu

The **Word List** menu can contain up to ten word lists. This provides a way to quickly access your favorite word lists. You can choose which word lists (up to ten) to have in the menu. Choose **Word List Menu** from the **Options** menu. To add word lists to the menu, select one or more word lists in the "available word lists" list box (on the left). Click on the right arrow button and the word lists will be added. To remove word lists from the menu, select one or more word lists from the "word lists in menu" list box, and click on the left arrow button. When you have the word lists that you want in the menu, click on the **OK** button.

Fonts

The font used to display the word lists and puzzle on the screen and used for printing puzzles can be any TrueType font installed in Windows. The point size is fixed, but you can choose the font, along with whether you want it bold or italic. You can have a different font for the display than your printer, because some fonts are visually appealing when printed, but are hard to read on the screen.

To set the display font, choose **Display Font** from the **Options** menu. This will display the font dialog. From here, select the font you would like, along with its attributes, and click on the **OK** button. The display will instantly change to the font you choose.

To set the printer font, choose **Printer Font** from the **Options** menu. This will display the font dialog. From here, select the font you would like, along with its attributes, and click on the **OK** button.

Music and Sound Effects

If you have an audio board configured for Windows, and have your MIDI mapper configured properly (refer to the documentation for your audio card to if you need help doing this), *MVP Word Search for Windows* will play music in the background while you are searching for words. If you do not have an audio card, or it is not configured properly, the **Music** choice in the **Options** menu will be inactive (grayed out). To disable the music, choose **Music** in the **Options** menu. To enable the music, choose the same menu item. A check will appear next to the menu item when the music is enabled.

MVP Word Search for Windows will play sound effects if you have an audio card installed and configured for Windows. If there is not one installed, or it is not configured, the **Sound Effects** choice in the **Options** menu will be inactive (grayed out). To disable the sound effects, choose **Sound Effects** in the **Options** menu. To enable the sound effects, choose the same menu item. A check will appear next to the menu item when the sound effects are enabled.
