

New in Version 2.4 of WebLeech?

This is a minor, and we're afraid to say **FINAL** version of WebLeech 2. We would like to thank all you WebLeech users out there, without your comments and support we'd never have got the product to the stage it's at now.

This release only fixes a few minor issues but since they are ones that would stop you viewing particular sites we thought it important to include them in a fix. In particular we would like to thank **Jason Berry** for all his help during the WebLeech development, without whom, WebLeech would not be the success it is today.

- **Case Sensitive Fix** : WebLeech no longer changes the case on your remote URLs, so if you received errors about an invalid URL even after you'd double-checked, the chances were it was because of this. This has now been fixed and all case is preserved.
- **Performance Fix** : General application Performance has been improved slightly.
- **Password Save Fix** : Some users were experiencing problems with passwords for sites not being saved and having to re-enter them each time.. this has now been fixed.
- **Other minor fixes** : A number of minor fixes have now also been applied, including the "Key Already Associated" error that a small number of users were experiencing.
- **"Document Contains no Data"** when reporting a bug has now been fixed, the default URL now points to our new (www.voodoo-software.com) server.
- **Hang when showing splash screen**. Some systems with a large number of drives would sometimes hang when the WebLeech splash-screen was displayed. This problem has now been fixed (thanks to Jay)

Even though this is the final Version of WebLeech2.... Prepare yourselves for a new era of Leeching..
