

PRINTCON.FSL is a small speedbar-like utility I use while working in Paradox for Windows 5.0

Because I must frequently switch between printing to my LaserJet and printing to my Fax modem, I needed to be able to quickly change my destination printer driver from one to the other without the fuss of using FILE | PRINTER SETUP

Using the 'Sendkeys' command in the buttons, I send the current form the necessary keystrokes to swith to the appropriate printer.

To customize for your own use, simply use the keyboard to make your printer selection (for example ALT-F-R-H-ENTER selects File, Printer Setup, HP LaserJet) and record EACH keystroke as you go. Then convert any ALT keystrokes to a percent sign ("%") and place the keystrokes inside the quotes after the SENDKEYS statement.

Select the 'P' or 'F' button (for Printer or Fax) on the form, right-click and select 'methods', then 'pushbutton'. You will see the SendKeys command. This is where you need to place your own keystrokes.

For additional information, see your online Paradox help under 'SendKeys'
