1.1   Miscellaneous Disk Utilities

```
Filename            ComandsSizeDescription
amosQfor.lha          VX    49K Q4mat V1.00 by Depeche Software - This
                                formats DOS disks, but it formats only
                                track 0 and 40.  It's enough to reformat a
                                DOS disk.  Written in Amos.
catch100.lha          VX    26K CatchDisk 1.0 by Alessandro Sala - Its
                                purpose is to detect when a new disk is
                                inserted in any drive and check if it is
                                properly formatted: if not, CatchDisk
                                executes the Format program with the
                                drive, in which the disk was inserted,
                                already  selected. The user has only to
                                choose the format options and start the
                                operation.
clicknot.lha          VX     3K ClickNot 37.3 by Richard Waspe - This is
                                to stop your floppy disks from clicking.
                                It  works under WB2 and above and can be
                                run  from the CLI, the Workbench or from
                                your WB Startup draw. It will
                                automatically detect  DF0: to DF3: and
                                stop them clicking. In its grotesque 348
                                bytes it even has a version  string.
dcmp1.52.lha          VX    59K DCMP - Disk CoMPare utility 1.52 by Tobias
                                Ferber - DCMP compares two disks block by
                                block. This is of great use if you want to
                                verify a copy of a disk that was copied in
                                the same way (block by block). It was
                                mainly written to test the reliability of
                                a Video- Backup-System.
ded1_1.lha            VX    50K Disk-Editor 1.1 - This is a new Disk
                                Editor with many features, it was written
                                to be  used mostly to repairing of disks,
                                on which failed repairing programs, or for
                                other  "fine" work on disk especially on
                                DOS  structures. You can also use it as
```

```
                                binary disk editor.
delEd.lha               VX    37K Deluxe Editor 1.8b by Cath of LSD – This
                                is a disk editor with the following f
df234.lha               VX    18K DirFool 2.34 (7.1.94) by Chris Lawrence –
                                When using KS2, this replaces the Di
disk1128.lha            VX    82K DiskSalv II 11.28 by Dave Haynie – This is
                                a disk recovery program for all devices
                                that  use any of the 2.04/2.1/3.0 file
                                systems.  DiskSalv will scan (analyze) a
                                bad disk  volume for anything that can be
                                recovered, and will restore these items to
                                any AmigaDOS volume. Has many other
                                Features.
disktool.lha            VX    21K Disk tools by Cath of LSD TrackINS – Put
                                file onto the tracks of disk, BlockINS –
                                Put file onto the blocks of disk, CuteSum
                                – Calculates or clears the disk checksum
                                and BlockRead – Reads the blocks of a disk
                                and saves it as a file.
dskinfo.lha             VX    37K Disk info Tools 1.0 by Barney Blankenship
                                – This can display a pie chart of your
                                directories, has a file finder and lets
                                you compare two directories.  Docs in the
                                program.
dup045.lha              VX     6K Disk-upgrader 0.45 by Cyberactif – DUP is
                                a nice tool for those who want to release
                                trainers, fix-files, or something else
                                like this. It compares two disks and
                                writes the  different blocks into an
                                executable and  self-extracting file. The
                                file can then be crunched with any
                                executable file-cruncher.
dwipe.lha               VX     3K D-Wipe version 1.0 by Shagratt of LSD –
                                This utility is for bulk erasing disks.
                                Insert a disk in DF0: and either click on
                                the WIPE gadget with the Left Mouse button
                                or hit the Return key. The disk is wiped
                                in one second, repeat the procedure as
                                often as needed. You can click on the quit
                                gaget or  hit Escape to quit this utility.
fcd102.lha              VX     4K FCD V1.02 by Nico Max – FCD stands for
                                Fast Change Directory and might be a
                                useable  replacement for the original
                                command "CD". So if you want to change to
                                a dir lying in  the deepest jungle of your
                                HD f.e. bla/hi/ jo/here/is/right. With FCD
                                you only write: FCD right.
filex11.lha             VX   176K FileX 1.1 by Klaas Hermanns – This is a
                                binary file editor which offers many
                                features.
fsinfo10.lha            VX     5K File System Info 1.0 by Stephane Requena –
                                Somtimes I was getting some unreadable
                                Directory Cache formated disks to OS2.0 or
                                OS1.3 users. There was no means to know
                                the FileSystem used for a disk in the C:Execute C ↩
                                  :
                                commands, I know with SysInfo or DiskSalv
```

```
                              its possible, but I don't want to load
                              that everytime!
headc372.lha        VX    9K Head Cleaner 37.2 by Richard Wasp - This
                              is for cleaning your floppy disk drive
                              heads.  It works by stepping the heads in
                              across the cleaning surface of the head
                              cleaning disk, thus continually exposing
                              the heads to fresh uncontaminated cleaner,
                              whilst greatly increasing the life of your
                              cleaning disk.
med-t-.lha          VX    5K Turbodisk version 1.7 by Yoghurt - This is
                              able to transform your diskdrives 2 - 8
                              times faster. This proggie is composed of
                              two parts which are working in
                              co-operation. The first part is a
                              blitter-patch which  increases the drive
                              speed, the second is a file cache located
                              somewhere in the availble memory.
messy11.lha         VX    3K Messyfy 1.1 - This is a CLI-only program
                              designed to "smartly" convert Amiga- style
                              file names to MS-DOS' brain-dead "8+3"
                              style, trying to keep them understandable.
                              In the meantime, Messyfy creates a script
                              (called "execute.me") useful to rename
                              back the files to their original Amiga
                              names.
pc37104.lha         VX  374K PowerCache 37.104 by Michael Berg - This
                              is a flexible and powerful disk Caching
                              system.
pvtree12.lha        VX   37K PVTree v1.2 - Show and print any disk
                              tree  structure, like on PC file managers.
                              Needs MUI.
qdir.lha            VX   14K Qdir v1.36 by Gregg Scholfield - Qdir was
                              written for those of us who use the CLI.
                              Have you been frustrated with the random
                              order of files when using the AmigaDOS
                              LIST command? Or the nice orderly
                              appearance of the DIR command but with no
                              file statistics? I have, and that's why I
                              wrote this program.
qdisk201.lha        VX   31K QDISK (Query Disk) 2.01 By Norman Baccari
                              - This provides you with the ability to
                              monitor, from WorkBench, the space usage
                              of all AMIGA DOS disk volumes that are
                              currently mounted. QDisk can also send you
                              a notification when usage exceeds a limit
                              set by you.
rlx-ff.lha          VX   11K FindFile 3.0 by Valkyrian Of Reflex - The
                              reason for creating FindFile is of course
                              to find a file. I got bored wandering
                              around in my enormous amount of
                              Directories to find a file I knew existed
                              but didn't know where.  This program will
                              search the directory  specified and all
                              sub-directories beneath as well.
scsiutil.lha        VX   55K SCSIUtil V2.0 by Gary Duncan and Heiko
                              Rath - A utility to do some low level
```

```
                                    stuff with SCSI devices.
separ1.0.lha           VX     9K SERPAR 1.0 by Matti Rintala - This opens
                                    a  window and then copies everything from
                                    the serial port to the parallel port. When
                                    its  window is closed, it quits. This way
                                    I can  set A2000 to print everything to
                                    the serial port and redirect the output to
                                    the printer on my A4000. great for Parnet
                                    users! KS2+
showd02.lha            VX     2K Showdisk by EQU - This is used to display
                                    the ASCII (>31, <127) contains of your
                                    disk on your default output.  Currently
                                    only disks with 80 Tracks (512 bytes
                                    blocksize) are supported.  KS2+ needed.
showl10.lha            VX    18K Showslink 1.0 - Shows links in all
                                    directories, documentation in German, but
                                    looks easy to use.
String11.lha           VX    14K Strings 1.1 by Anders Lindgren - This is a
                                    short utility program written to find
                                    character strings in any type of file,
                                    typically an executable. It will read the
                                    file, searching for all strings. If one is
                                    found, it is printed out.
zap244.lha             VX     9K Zap 2.44 by Timo Rossi - Zap is a binary
                                    file view/edit program. You can examine
                                    and modify the file in hexadecimal and
                                    ASCII  mode. Zap keeps the file in memory,
                                    so  moving in the file and searching is
                                    very  fast, but available memory limits
                                    the size of files that zap can handle. KS2
                                    required.
```
