1.1 Text Editors

```
Filename          ComandsSizeDescription
AGWriter102.lha      VX    22K AmigaGuide Writer 1.02 by D.L McPaul - A
                              program that allows you to create quickly
                              and easily AmigaGuide format files from a
                              text file.
ced2xen.lha          VX    48K Ced 2 Xen - This patches Cygnus Editor pro
                              (CED) version 3.5 with XEN font menus.
hypan107.lha         VX    78K Hyperansi 1.07 by Mike D. Nelson - This
                              allows you to easily create ANSI graphics
                              with minimum effort. Unlike previous
                              releases of HyperANSI, this version has
                              no  "crippled" features, and no longer
                              displays that annoying delay screen.
pansi114.lha         VX    75K ProANSI 1.14 by Marcel Offermans - This is
                              a flexible ansi editor. I started writing
                              this program last year, because I was not
                              satisfied with the existing programs. They
                              all had their strong points, but neither
                              of them was complete. Because I
                              desparately  needed a good program for the
                              design of all menus for my BBS I wrote
                              ProANSI.
sigma133.lha         VX   131K Signmaker 1.33 by K.Veijalainen - I got
                              tired of making those awful ascii pics
                              with a text editor, character by
                              character. The  bitmap-to-ascii-converters
                              I have seen have done the trick by
                              printing a line of text,  moving the
                              "cursor" down a pixel or two, and then
                              printing again. Nice, but (as far as I
                              know) only works on Amy.
sm14d.lha            VX   112K SigMaker by K.Veijalainen - I got tired of
                              making those awful ascii pics with a text
                              editor, character by character. What I was
                              looking for was a painting program, but
                              with which you could paint with
                              characters. I  found no such suitable
                              program, so I made this program.
```

```
tedit22.lha           VX   92K TEdit 2.2 By T. Gamble - A simple but
                                useful text editor, Created with CanDo 2.0.
textra15.lha          VX  163K TEXTRA 1.15 by Mike Haas - This is the
                                User- Friendly Text Editor for the Amig
tpp500.lha            VX  751K TeXt Plus Pro 5.0 by Martin Steppler - TPP
                                is a TeX front end word processor, with
                                the help of TPP you can easily create TeX
                                documents without knowing anything about
                                TeX.
tpp501ud.lha          VX   25K Text Plus Professional upgrader from TPP
                                5.00 to 5.01 by Martin Steppler. First
                                you  must install TPP 5.00. If TPP 5.00
                                only  printed "Unable to open
                                keymap.library" on  your screen, this is
                                history now.
